3 Li^{1+} Lithium Ion

Atomic Number (number of protons)
Ion Formula (the charge on this ion is 1+ because lithium lost 1 electron to become the stable ion)
Ion Name (identifies the ion: a positve monatomic ion keeps its element name, **ion is named lithium ion)**

9 F^{1-} Fluoride Ion

Atomic Number (number of protons)
Ion Formula (the charge on this ion is 1- because fluorine gained 1 electron to become the stable ion)
Ion Name (identifies the ion: a negative monatomic ion changes the ending to –ide, **ion is named fluoride ion)**

Common Polyatomic Ions

thiocyanate	SCN^{1-}				

Rules for changing polyatomic ion names when #oxygens change

1. If 1 more oxygen than the root, add the prefix "per" to the name: ex) MnO_4^{1-} is permanganate
2. If 1 less oxygen than the root, change ending to "ite": ex) ClO_2^{-1} is chlorite
3. If 2 less oxygens than the root, change ending to "ite" and add prefix "hypo": ex) NO^{1-} is hyponitrite
